## PTSG and Riverlight Quay

# PTSG and Riverlight Quay

PTSG was recently on site in Battersea at Riverlight Quay, where its engineers delivered specialist building access services.

Riverlight Quay is a new residential development directly on the riverfront in the heart of the new Nine Elms on the South Bank district, London's largest regeneration area. Designed by award-winning architects, the development is made up of six brightly coloured pavilions. There are 806 luxury apartments in the development, from one and two-bedroom apartments with a terrace to three-bedroom penthouses.

Experienced rope access technicians from PTSG Building Access Specialists Ltd ensured the entire exostructure of the development was safe and secure. This involved checking and tightening over 400 individual nuts and bolts.

This project is extremely typical in the day-to-day work of PTSG's engineers and technicians, who employ a range of access techniques to reach all parts of buildings, carrying out a full range of specialist services.

All techniques for accessing a building's façade require specialist training. Rope access is commonly accepted as the safest and most efficient method, enabling operatives to install and remove all equipment quickly, causing minimal disruption and saving valuable time.
